# Background & objectives

# Background

**All water companies have a statutory obligation to produce a Water Resources Management Plan (WRMP) which sets out how they will meet demand for public water supplies over a minimum 25 year period.**

The updated Water Resources Planning Guidelines require companies to follow a 'Best Value Planning' approach via an MCDA process/tool.

This involves the selection of decision metrics to characterise plan alternatives, and development of weights to determine how these metrics should be balanced against one another in decision making.

Water companies are also required to work collaboratively to develop a strategic Regional Plan for water resources, so these decision weights will be incorporated within both the regional MCDA tool and the individual company MCDA models.

To this end, United Utilities and Severn Trent (members of the regional Water Resources West (WRW) group), commissioned a joint piece of customer research and South Staffs Water (another member group) shared the same metrics choice experiment design with the other two water companies so that the decision weights can be incorporated within the common Water Resources West MCDA tool.

This report outlines the findings for United Utilities only.

# Objectives

**The study explored, through stated preference choice exercises:**

1. customers' attitudes and views regarding the natural environment and UU's approach to planning
2. customers' ranking of UU's water supply options to meet demand over the next 25 years
3. customers' preferences for WRMP options to obtain weights for WRW MCDA decision metrics
4. customers' priorities with regards to levels of service concerning Temporary Use Bans (TUBs) and Extreme Events

# Methodology

# Two audiences

## Household Customers

- An online approach was adopted to survey a representative sample of 671 household customers across the region using customer sample and customers via an online panel provider
- Customers had to have sole/joint responsibility of the water bill
- Quotas and weights were applied to age, gender, region, urban/rural, socio-economic grade and metering

## Business Customers

- A similar online approach was adopted to survey a disproportionate sample of 184 business customers across the region using an online panel provider
- Business customers had to have complete responsibility or at least oversight of the water bill
- Quotas and weights were applied to reflect the profile of NW businesses as a whole in terms of business size

# Household sample

671 completed interviews were conducted with United Utilities residential customers in the region.

The below quotas and weights were used to help reach a sample representative of residential bill payers.

Age	Weighted	Unweighted
Age 18 to 29	5%	3%
Age 30 to 44	22%	21%
Age 45 to 59	34%	28%
Age 60 to 74	25%	33%
Age 75 Plus	14%	15%

Gender	Weighted	Unweighted
Male	49%	58%
Female	51%	42%

Location	Weighted	Unweighted
Merseyside	20%	20%
Cumbria	7%	8%
Gr Manc	37%	31%
Lancashire	21%	23%
Cheshire	14%	18%

Location	Weighted	Unweighted
Urban	38%	44%
Rural	17%	19%
Suburban	46%	37%

SEG	Weighted	Unweighted
AB	22%	34%
C1	31%	28%
C2	21%	14%
DE	26%	24%

Metering	Weighted	Unweighted
Meter	46%	63%
Unmetered	54%	37%

## Business sample

184 completed interviews were conducted with businesses in the United Utilities region.

Whilst a range of sectors were represented, quotas and weights were applied on business size. Medium and larger businesses were over represented allowing for subgroup analysis rather than being reflective of the business profile of the United Utilities region.

Business size	Weighted	Unweighted
Micro (0-9)	35%	20%
Small (10-49)	20%	23%
Medium (50-249)	24%	31%
Large(250+)	21%	26%

# Cognitive interviews – Phase 1

To ensure the survey was effective in its design, a number of cognitive interviews were conducted. These revealed areas in need of adjustment – whilst there were elements that needed amending throughout the survey, the main issues related to the choice experiment simply due to the volume of information that needed communicating.

The initial cognitive pilots highlighted that the materials weren't working optimally. People were struggling with the wording and querying the scales used for the metrics and how to interpret the scales, in particular use of the word 'moderate'.

It was apparent that, whilst the survey couldn't accommodate fuller descriptions of the levels in the scales, the summarised wording was causing issues. To this end, symbols were used instead and the materials retested.

## Catchment management

Option description	United Utilities can protect and enhance the water environment through managing the surrounding land through which water in any form (such as rain, melting snow or ice) drains into a body of water (i.e. a river, lake or reservoir).		
Relative cost	£	Human & social wellbeing	Moderate positive impact
Carbon	No significant impact	Habitats for native wildlife & plants	Moderate positive impact
Flood risk	Moderate reduction	River flows & water quality	Moderate improvement

	Catchment management	Reduce or 're-use' water indirectly	Take more water from the ground	Increase the size of existing reservoirs	Surface water	Increase capacity of water treatment works	Transfer water from other regions	Reduce leakage	Initial more water inlets	Improve water efficiency
Relative cost	£	£ £	£ £	£ £	£ £ £	£ £	£ £ £	£ £ £	£ £ £	£ £ £
Carbon	No significant impact	Moderate increase equivalent to the emissions of around 75 households per year	Moderate increase equivalent to the emissions of around 75 households per year	No significant impact	Moderate increase equivalent to the emissions of around 75 households per year	Moderate increase equivalent to the emissions of around 75 households per year	Moderate increase equivalent to the emissions of around 75 households per year	Moderate reduction equivalent to the emissions of around 35 households per year	Moderate reduction equivalent to the emissions of around 35 households per year	Moderate reduction equivalent to the emissions of around 35 households per year
Flood risk	Moderate reduction	No significant impact	Moderate reduction	Moderate reduction	Moderate reduction	No significant impact	No significant impact	No significant impact	No significant impact	No significant impact
Human & social wellbeing	Moderate positive impact	Moderate negative impact	Moderate negative impact	No significant impact	No significant impact	No significant impact	Moderate negative impact	Moderate positive impact	Moderate positive impact	Moderate positive impact
Habitats for native wildlife and plants	Moderate positive impact	No significant impact	Moderate negative impact	Moderate negative impact	Major negative impact	No significant impact	Moderate negative impact	Moderate positive impact	Moderate positive impact	Moderate positive impact
River flows & water quality	Moderate improvement	Moderate improvement	Moderate deterioration	Moderate improvement	Major deterioration	No significant impact	Moderate improvement	Moderate improvement	Moderate improvement	Moderate improvement

# Cognitive interviews – Phase 2

A significant minority failed to understand the proposed symbols, largely due to the key being ignored because it was at bottom of the slides.

## Managing the land to improve water quality

Option description	United Utilities can protect and enhance the water environment through managing the surrounding land through which water in any form (such as rain, melting snow or ice) drains into a body of water (i.e. a river, lake or reservoir).		
<b>Relative cost:</b> How much this option will cost relative to the other ones you'll be shown	£ £ £	<b>Human &amp; social wellbeing</b> - impact on the local area and environment e.g. job creation, economy, local green spaces for public health and wellbeing	– – + +
<b>Carbon emissions:</b> The release of carbon into the atmosphere	No impact	<b>Habitats for native wildlife &amp; plants</b> - impact on natural ecosystems, biodiversity and wildlife habitats	– – + +
<b>Flood risk:</b> likelihood this option will have a positive or negative impact on the risk of homes, businesses, gardens and public spaces flooding	– – + +	<b>River flows &amp; water quality</b> - impact on the volume and cleanliness of water available to use in rivers and lakes	– – + +
This is the cost to United Utilities but will impact on customer bills further down the line. The more <b>£ signs</b> shown, the higher the cost and the greater the likelihood this will impact customer bills.	£	The amount of increase in each measure this option will result in. The more <b>green plus</b> signs, the more the positive impact or reduction in negative effects!	+
		The amount of reduction in each measure this option will result in. The more <b>red minus</b> signs, the more the negative impact or increase in negative effects!	–

	Managing the land to improve water quality	Recycle or 're-use' water indirectly	Take more water from under the ground	Increase the size of existing reservoirs	Take more water from rivers and lakes	Increase capacity of water treatment works	Transfer water from other regions	Reduce leakage	Install more water meters	Improve water efficiency
Relative cost	£ £ £	£ £ £	£ £ £	£ £ £	£ £ £	£ £ £	£ £ £	£ £ £	£ £ £	£ £ £
Carbon	No impact	– +	– +	No impact	– +	– +	– +	– +	– +	– +
Flood risk	– +	No impact	– +	– +	– +	No impact	No impact	No impact	No impact	No impact

Habitats for native wildlife and plants	– +	No impact	– +	– +	– +	No impact	– +	– +	– +	– +
River flows & water quality	– +	– +	– +	– +	– +	No impact	– +	– +	– +	– +
This is the cost to United Utilities but will impact on customer bills further down the line. The more <b>£ signs</b> shown, the higher the cost and the greater the likelihood this will impact customer bills.	£									
		The amount of increase in each measure this option will result in. The more <b>green plus</b> signs, the more the positive impact or reduction in negative effects!								
			The amount of reduction in each measure this option will result in. The more <b>red minus</b> signs, the more the negative impact or increase in negative effects!							

# Cognitive interviews – Phase 3

The slides were redesigned with the key moved to the top of the charts. This made a big difference as respondents read the key first and thus understood the subsequent information.

## Managing the land to improve water quality

Each of the measures will have symbols alongside them so that you can see how this option stacks up against the others. The symbols' meanings are shown below:

<p>This is the cost to United Utilities but will impact on customer bills further down the line. The more £ signs shown, the higher the cost and the greater the likelihood this will impact customer bills.</p> <p>£</p>	<p>The amount of increase in each measure this option will result in. The more green plus signs, the more the positive impact or reduction in negative effects!</p> <p>+</p>	<p>The amount of reduction in each measure this option will result in. The more red minus signs, the more the negative impact or increase in negative effects!</p> <p>-</p>

---	--	---

# Executive Summary

# Context Setting

## The research was undertaken at a time of uncertainty:

- The COVID-19 pandemic was entering a second winter with Plan B restrictions announced
- Customers were beginning to feel the impact of rapid increases in gas and electricity prices
- Prominent news stories about CSOs pollution incidents
- COP26 summit in September 2021
- These issues may have had an impact on participants' views – for example COP26 news may have increased customers' carbon valuations given the prominence of the summit.
- Results from this study suggest that customers are engaged with and concerned about the environment/climate change, BUT they are also concerned about the impact of the cost of living crisis

# Results

## Supply-demand options preference

The top three water supply options for households and businesses were:

1. Reduce leakage
2. Improve water efficiency
3. Recycle or reuse water indirectly

Business customers, on average, had very similar priorities to households in terms of rankings but the preference for the top-ranked option of reducing leakage was weaker.

## Decision Metric Weights

	Customer survey value weights	Stakeholder workshop weights
Carbon emissions	3.60	1.00
Flood risk	1.58	[0.28, 0.70]
Human & social wellbeing	1.47	[0.70, 1.96]
Ecosystem resilience	2.09	[1.87, 1.87]
Multi-abstractor benefits	1.30	[0.84, 1.40]

- The preference weights of Carbon emissions and Flood risk are substantially higher than the SEA and NCA weights.
- The preference weights of Human & social wellbeing are in between the SEA and NCA weights.
- The preference weights of Ecosystem resilience/habitats are somewhat higher than the SEA and NCA weights.
- The preference weights of Multi-abstractor benefits (impacts on rivers) are somewhat lower than the NCA weights.

# Results

## TUBs

Analysis choices show that as the bill impact increases, the preference for an improved level of service tends to decrease – the preference shifts from a willingness to pay for a major improvement to the more modest improvement of 1 in 40 which is preferred over the ‘no improvement’ status quo option.

66.9% of household respondents preferred option 2 (1 in 40) over option 1 (status quo) at £1.90. This reduced to 63% of those on a household income of <£20k.

## Extreme Events

Analysis of the first choice set showed preference is firmly in favour of an improved level of service for Extreme Events (moving to 1 in 500 as soon as possible). Even at the highest bill impact shown to respondents we saw three quarters of customers preferring the improvement over the status quo.

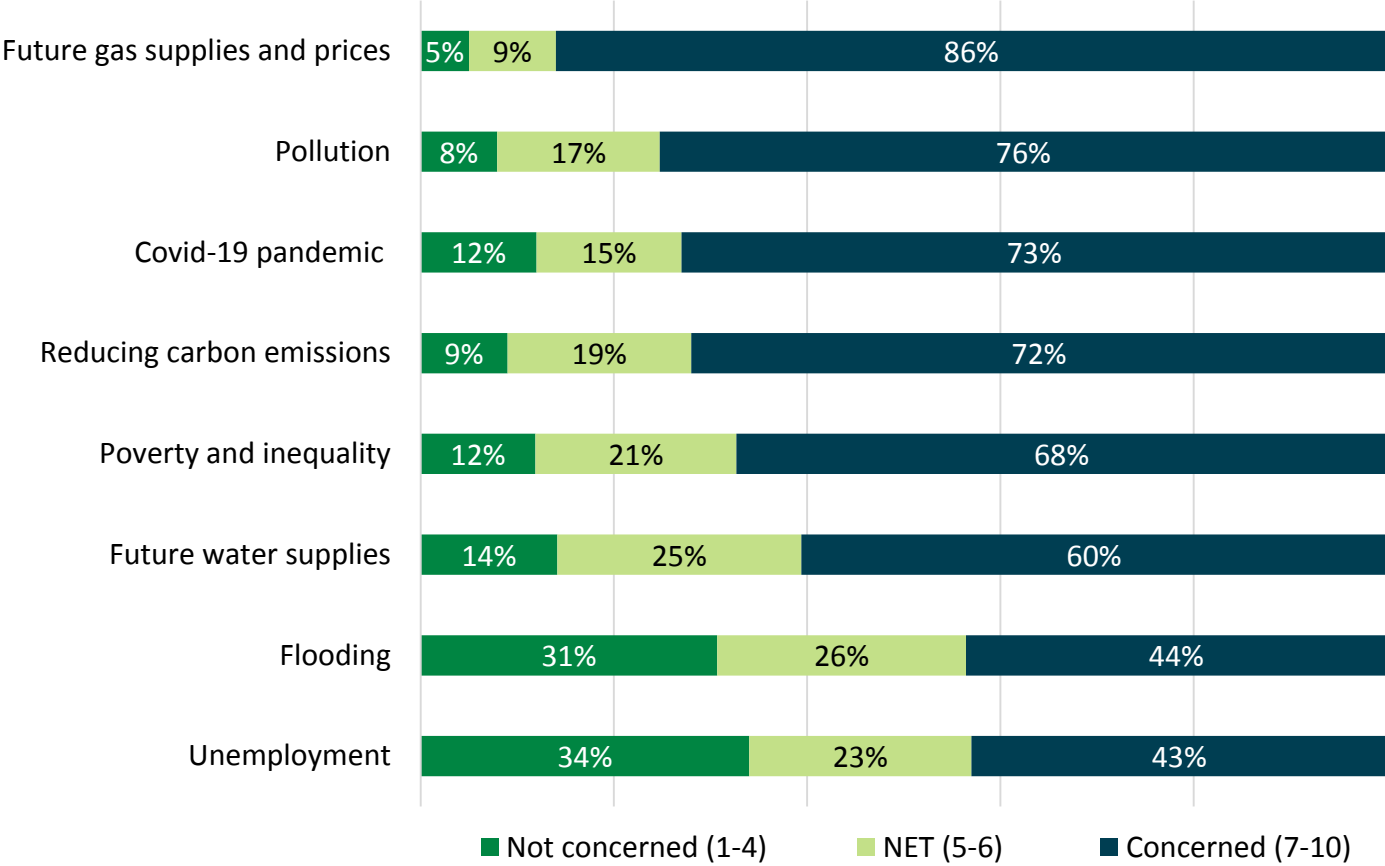

As the bill impact increased, the preference for an improved level of service decreased.

82.3% of household customers preferred option 2 over option 1 (1 in 500 by 2039) at £1.10. This reduced slightly to 80% of those on a household income of <£20k.

# Attitudes & behaviours

# Future water supplies ranks 6<sup>th</sup> in a list of current concerns

Level of concern about the following:

Perhaps not surprising given the time of fieldwork, concern around future gas supplies and prices is significantly higher

Those living in Lancashire were the most concerned about future water supplies (68%), significantly more than Cumbria (45%).

Households including someone with a disability were also significantly more likely to be concerned (67%) compared to those without (52%).

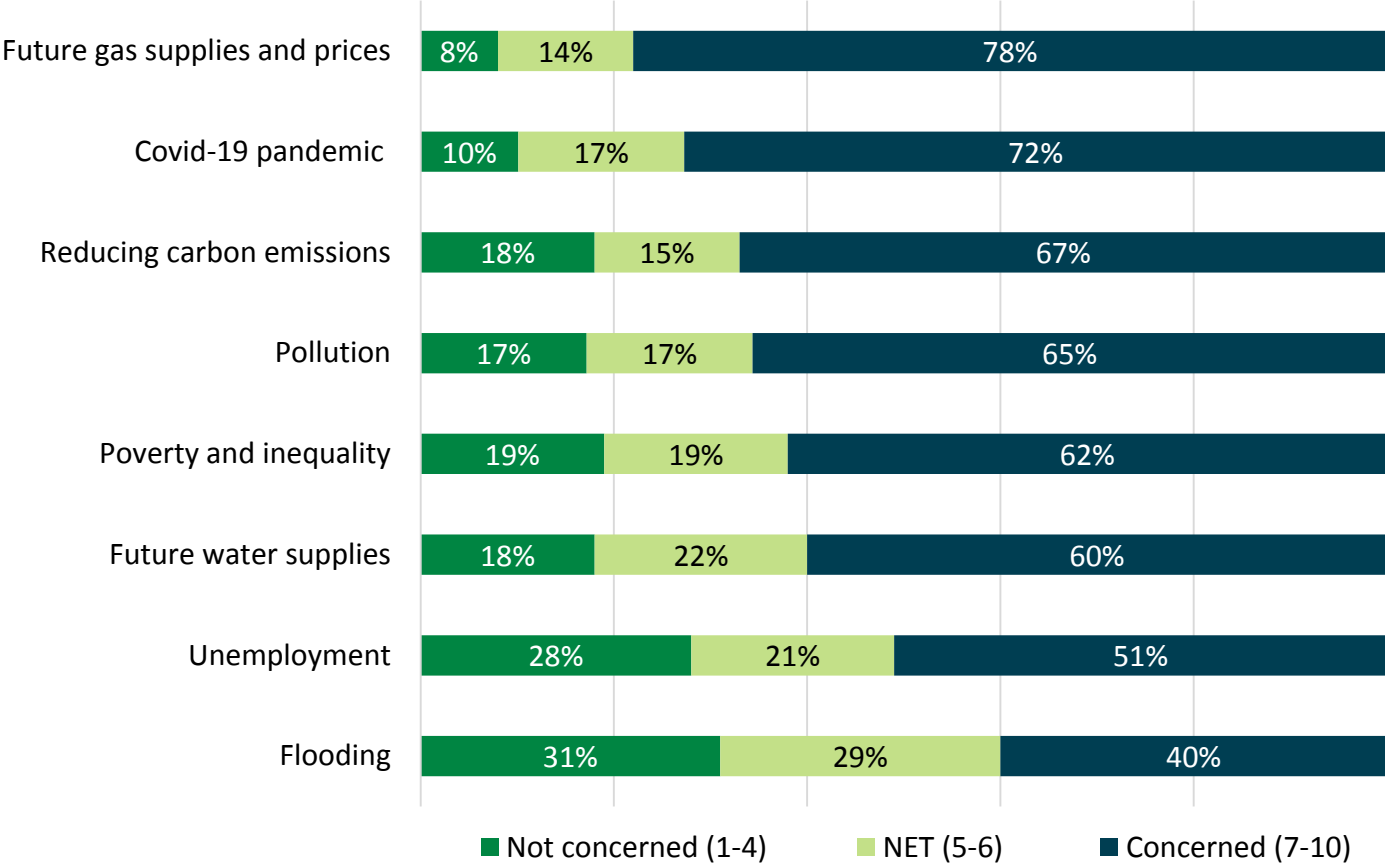

Those who say they sometimes struggle financially were significantly more likely to be concerned about future water supplies (63%) vs 54% who don't struggle.

Those with dependent children (53% vs 40%), and those with a disability in the household (48% vs 39%) were significantly more likely to say they are concerned about the risk of flooding.

Q01. On a scale of 1-10, where 1 is not at all concerned and 10 is extremely concerned, how concerned are you about the following? (All households excluding don't knows = Total: Above 471)

# Amongst businesses, future water supplies and flooding are relatively low levels of concern

Level of concern about the following:

However, medium and large businesses are significantly more likely to be concerned about the risk of flooding (54% & 75%) compared to Small (24%) and Micros (19%).

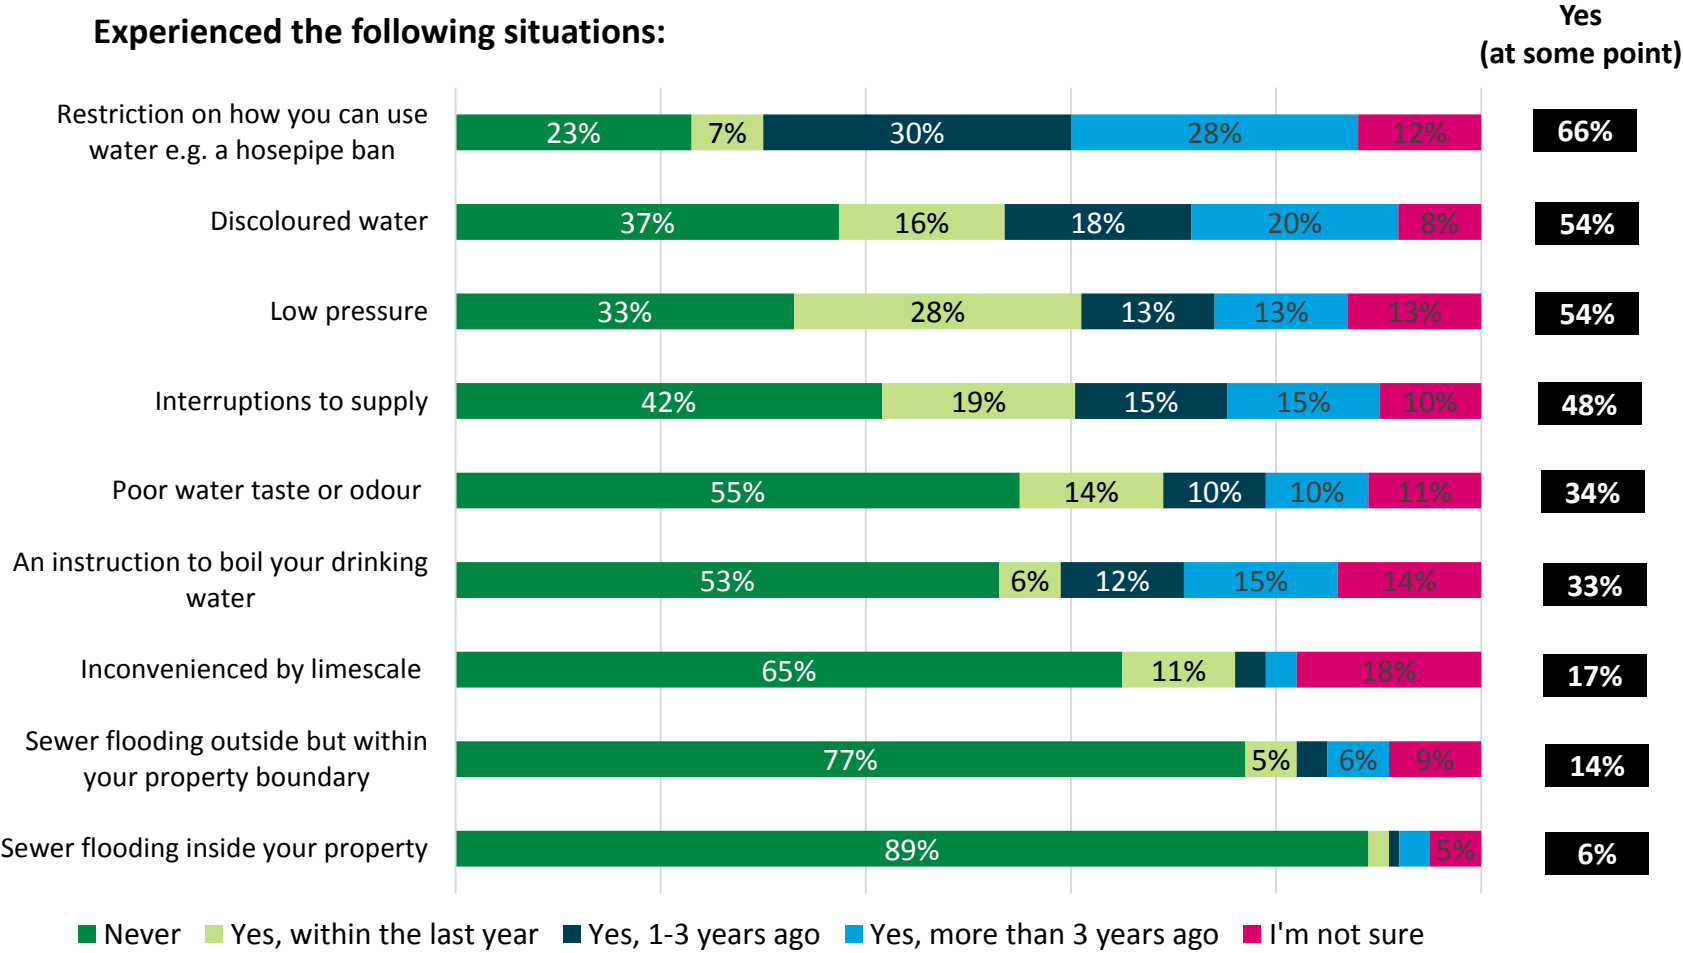

Similarly, medium and large businesses are significantly more likely to be concerned about potential water shortages (74% & 77%) compared to Small (51%) and Micros (44%).

Those with self-described medium or high levels of water consumption are also significantly more likely to be concerned with potential water shortages (73% & 79%) compared to those with low consumption (44%).

Q01. On a scale of 1-10, where 1 is not at all concerned and 10 is extremely concerned, how concerned are you about the following? (All businesses excluding don't knows = Total: 182 or above)

# Two-thirds (66%) of households recall, at some point in time, having a restriction on how they can use their water

Experienced the following situations:

Although only 7% claim this has happened in the last year whereas almost three in ten (28%) have had low pressure during this time.

Households from higher socio-economic grades are significantly more likely to recall a restriction on how to use their water at some point (ABC1 – 77% v C2DE – 57%).

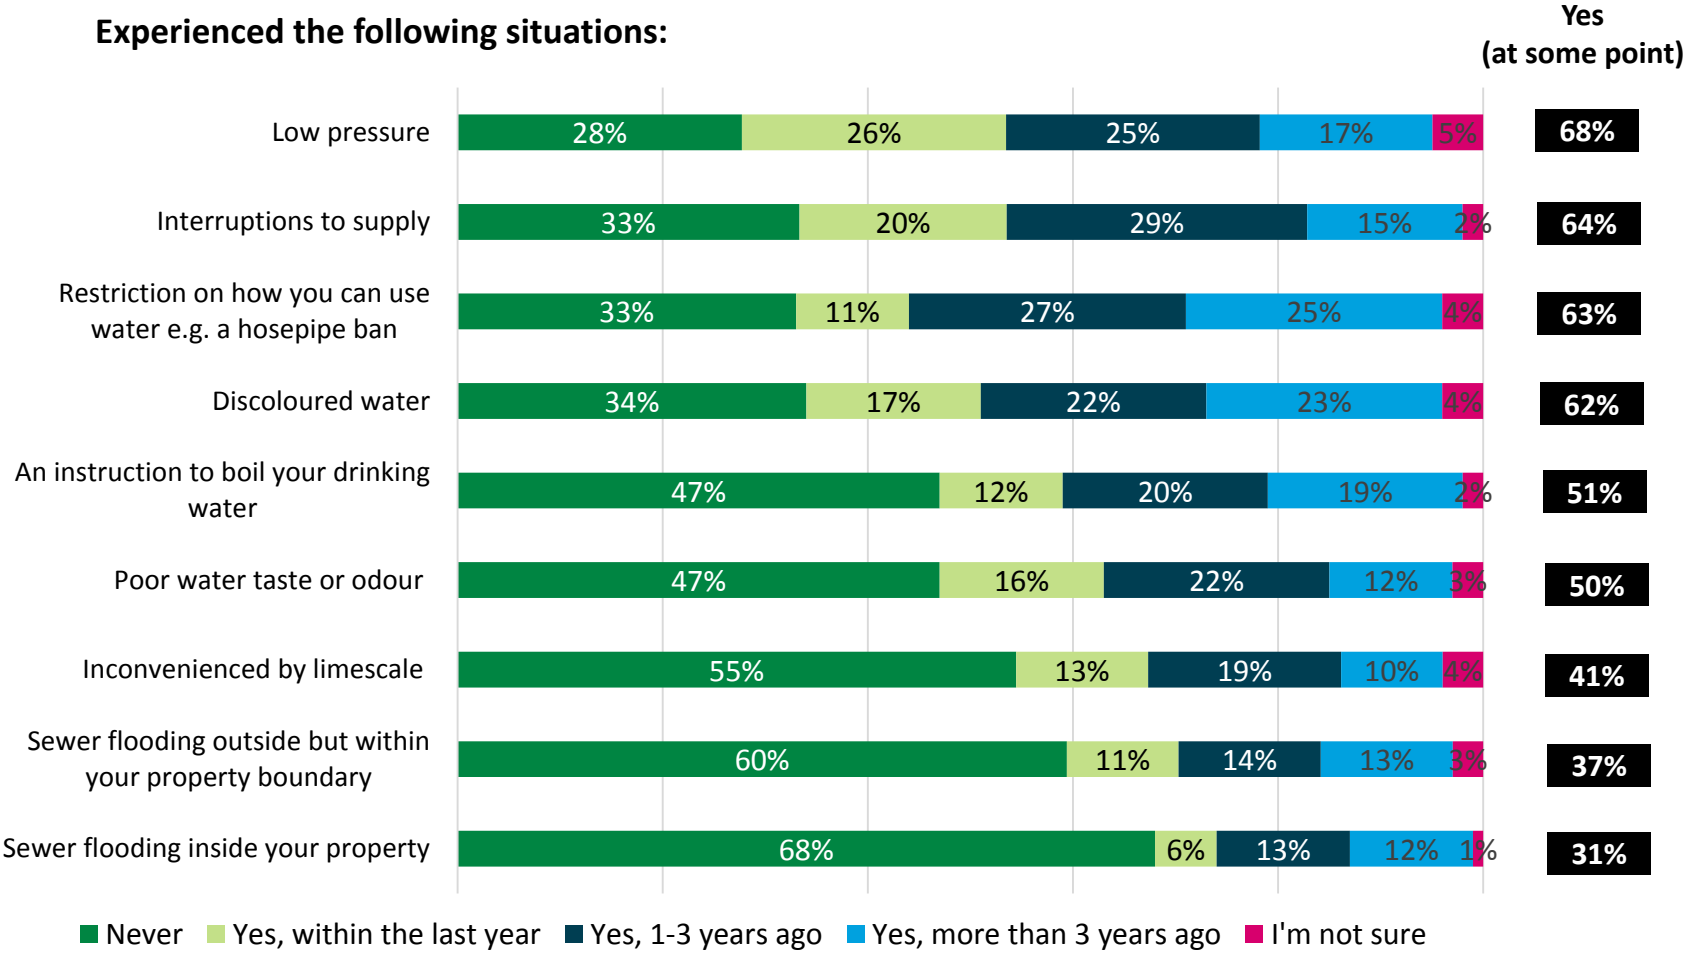

Households in rural and suburban areas are also significantly more likely to recall at some point having a restriction on how to use their water compared to those in urban areas (Urban – 58%, Suburban – 67%, Rural 76%).

The same is true of those with dependent children 51% vs 70% those who don't.

Q02. I'd now like you to say if you've ever experienced or noticed any of the following situations whilst living in the United Utilities region? (All households = Total:471)

# Businesses are notably more likely to have come across a wider range of issues compared to households

Experienced the following situations:

**Two-thirds (68%) of businesses recall experiencing low pressure and a quarter (26%) have experienced this in the last year.**

Experiences of sewer flooding are significantly lower than other issues, however, just under a third, still claim to have experienced this.

Medium and large sized businesses are significantly more likely to have experienced all these issues compared to small and micros.

Q02. I'd now like you to say if you've ever experienced or noticed any of the following situations whilst living in the United Utilities region? (All households = Total:471)

# The majority of households have at some point visited water bodies for recreational purposes (86%) and over half have done so in the last year (55%)

Visited rivers, lakes, reservoirs, the sea in Northwest for recreation purposes:

■ Never ■ Yes, within the last year ■ Yes, 1-3 years ago ■ Yes, more than 3 years ago

Yes  
(at some point)

Those from higher socio-economic grades are significantly more likely to have visited these sites than those from lower SEGs (93% ABC1 vs 80% C2DE)

Those living in Cumbria are significantly more likely to have visited water bodies for recreational purposes (98%).

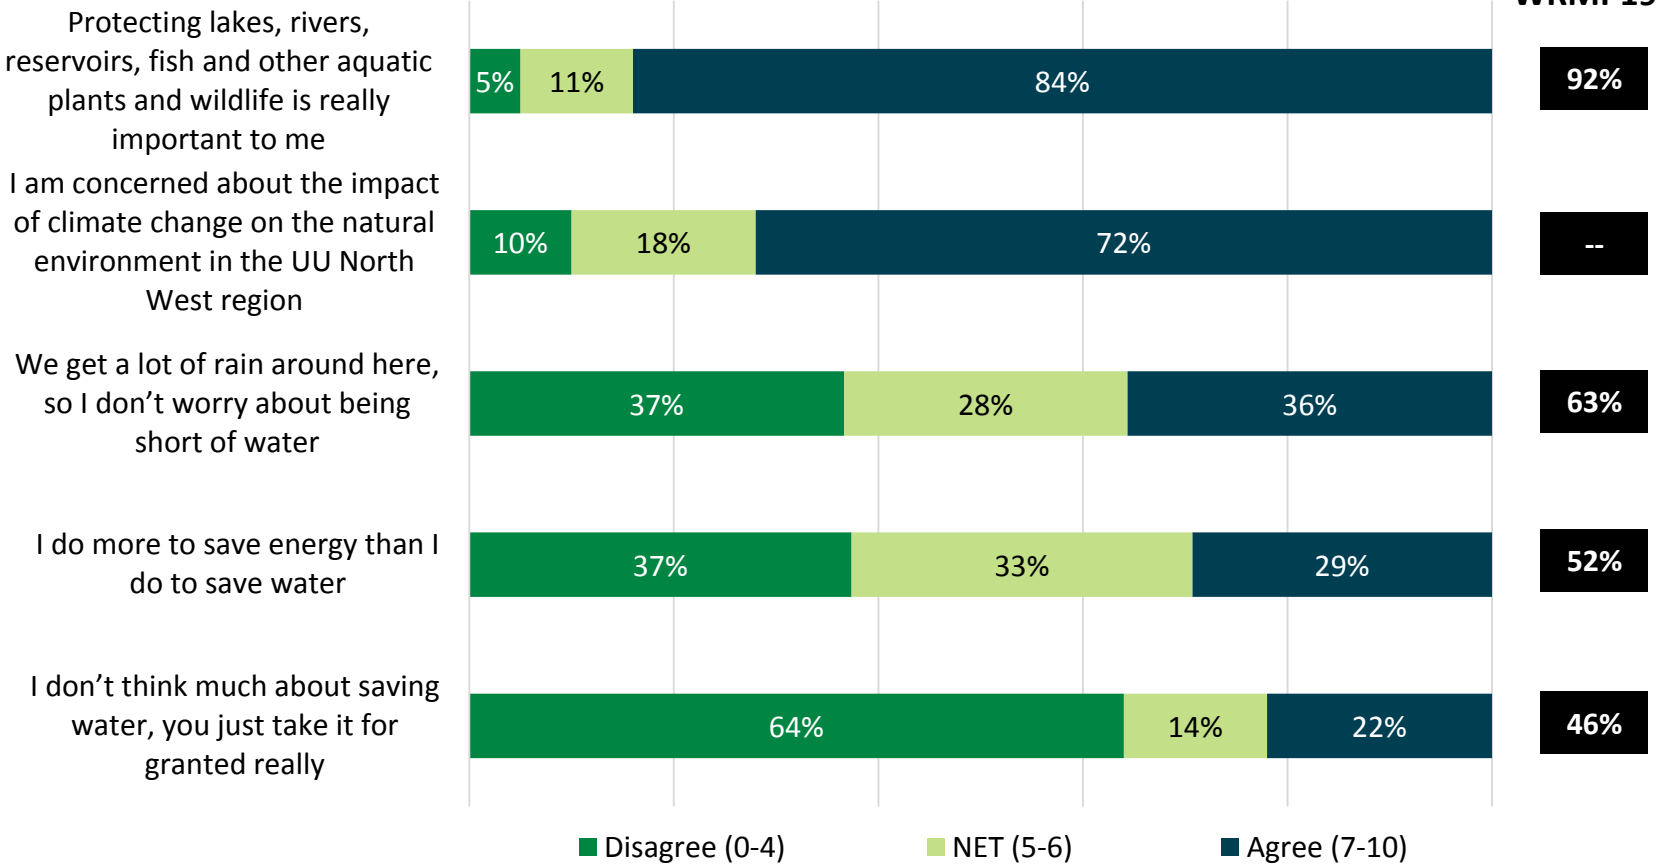

Whilst still a reasonable majority, those living in urban areas are significantly less likely to have visited water bodies (78%) compared to those from suburban (89%) or rural (92%) areas.

Those who live in households with incomes of less than £20,000 are significantly less likely to have visited them(78%).

Q03 Have you visited rivers, lakes, reservoirs, the sea in the North West of England for recreational purposes e.g. walking, fishing, swimming? (All households = Total households excluding don't knows:654)

# Almost two thirds of households disagree with the idea that they take water saving for granted

Level of agreement with the following:

**However, over a third (36%) are not worried about being short of water**

Those in Cumbria are significantly more likely to agree with this statement (60%) compared to all the other areas in the NW.

Those living in Cheshire are significantly more likely to be concerned about the impact of climate change on the NW (83%).

Those from lower socio-economic grades are significantly more likely to disagree they 'do more to save energy than I do to save water' (C2DE – 44% v ABC1 – 32%).

Q04. How much do you agree or disagree with the following statements? (All households = Total: excluding down knows : Above 656)

\*Please note agree scale was a five-point scale for WRMP 19

# Ranking & Choice experiment

# Supply-demand options ranking exercise

# Supply-demand options ranking exercise

## CHOICE FORMAT

Taking into account the various impacts of each of these options, which of these would you pick as a priority for maintaining water supplies in the region? Please rank your top 3.

Please [click here](#) to see all options.

Increase capacity of water treatment works	1	Reduce leakage
Recycle or "re-use" water indirectly	2	Install more water meters
Increase the size of existing reservoirs	3	Take more water from under the ground
Take more water from rivers and lakes		
Managing the land to improve water quality		
Transfer water from other regions		
Improve water efficiency		

## Respondents were asked to pick their top 3 priorities from a set of 10 supply-demand options.

- The same set of 10 options was shown to household and business respondents.
- The order in which supply-demand options were shown varied randomly across respondents.
- Priority scores and rankings were obtained via a mixed logit modelling of respondents' choices, which allows for variation in preferences over the sample.
- Priority scores are a measure of preference intensity on a 0-100 scale.

## Stimulus shown in ranking exercise

### **Managing the land to improve water quality**

*United Utilities can protect and enhance the water environment through managing the surrounding land through which water in any form (such as rain, melting snow or ice) drains into a body of water (i.e. a river, lake or reservoir).*

### **Recycle or “re-use” water indirectly**

*Treated wastewater from sewage treatment works would be recycled into a river or reservoir before it is treated to tap water standard and used for drinking water supply*

### **Take more water from under the ground**

*United Utilities could increase the amount of water taken from under the ground by finding new groundwater sources. This water is naturally replaced when it rains.*

### **Increase the size of existing reservoirs**

*The size of reservoirs can be increased to store more water. This means that more water can be collected and stored when water is plentiful and used when it is not.*

### **Take more water from rivers and lakes**

*United Utilities could increase the amount of water taken from rivers and lakes.*

## Stimulus shown in ranking exercise (continued)

### **Increase capacity of water treatment works**

*United Utilities could increase the capacity of existing water treatment works. This would allow more water to be abstracted from existing sources.*

### **Transfer water from other regions**

*United Utilities could purchase water that is licensed to another water company. The bulk supply could originate from within our region but typically comes from outside our region, commonly via a pipeline from another water company.*

### **Reduce leakage**

*Leaks can occur from the water company's pipe network or in customers' homes. Methods used to reduce leakage include; Prevent (ability to stop leaks from occurring), Awareness (ability to identify a leak as it occurs), Locate (ability to find the exact location of the leak) and Mend (action to fix the leak).*

### **Install more water meters**

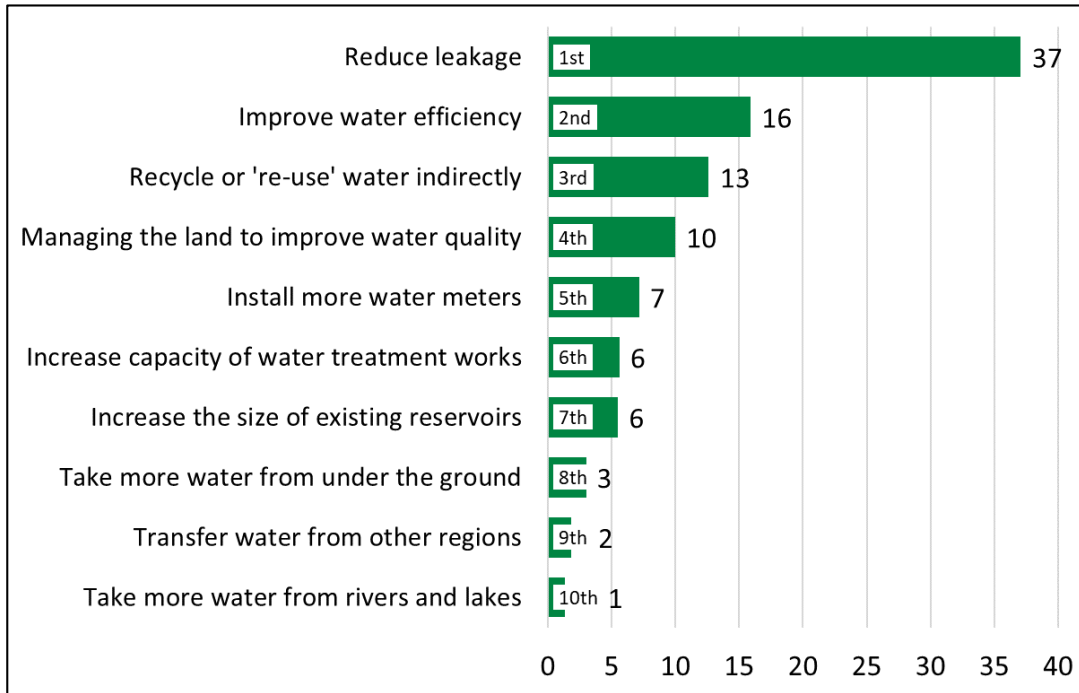

*Water meters are installed at customer properties. They reduce supply pipe leaks and also help customers' conserve water by providing visibility of the amount of water they are using. These meters can also provide information that helps the water company find leaks on its network.*

### **Improve water efficiency**

*Water efficiency is key to reducing customer water usage, which means that less water is used and therefore the water company doesn't need to produce as much. Water efficiency measures include, free water efficiency devices, subsidised water butts, free water efficiency home audits and educational programmes..*

# Priority Scores, Ranks, and Option Choices: Households

## Priority scores and ranks

Base: 671 household respondents (weighted)

## Option choice frequencies

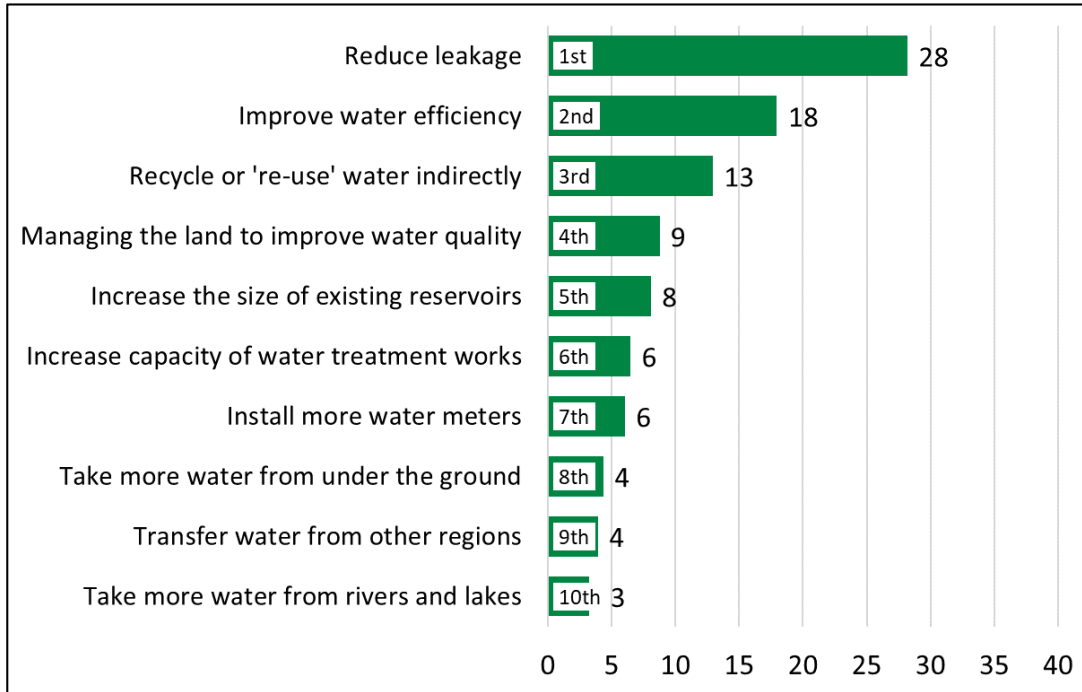

Base: 671 household respondents (weighted)

## For household customers, on average,

- reducing leakage is by far the highest priority;
- reducing leakage is followed at a distance by Improving water efficiency and Recycling or 're-using' water indirectly;
- the top three options account for around two thirds of the total 'importance weight'.

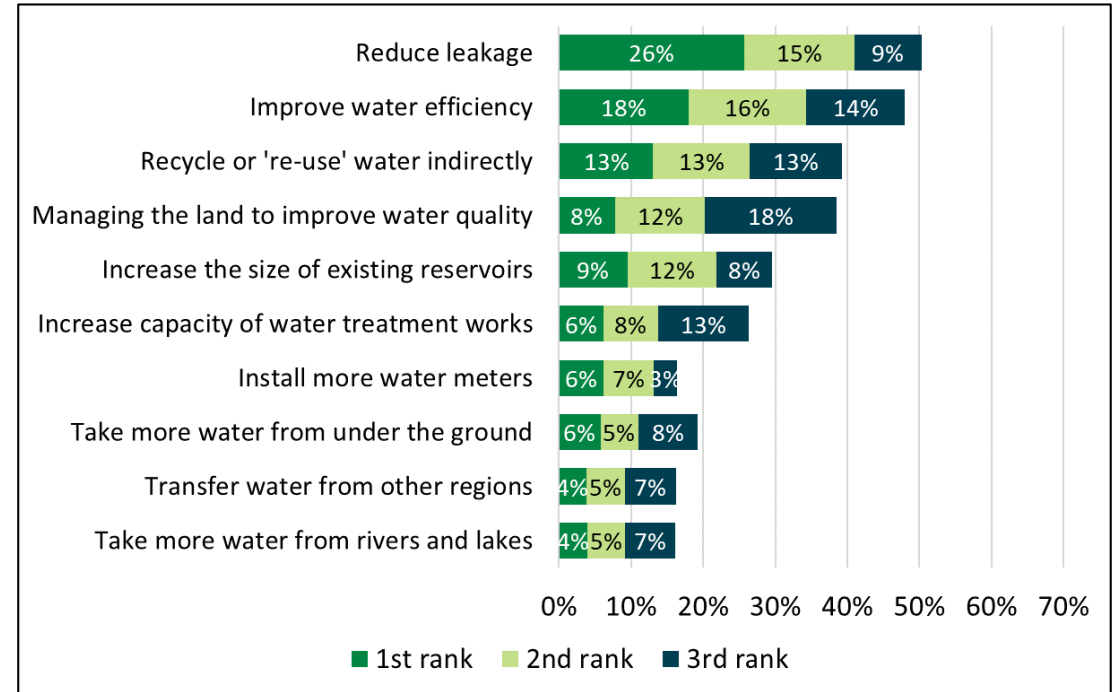

# Priority Scores, Ranks, and Option Choices: Businesses

## Priority scores and ranks

Base: 184 business respondents (weighted)

## Option choice frequencies

Base: 184 business respondents (weighted)

## Business customers, on average,

- have very similar priorities to households in terms of rankings (rank correlation = 0.95), but the preference for the top-ranked option of reducing leakage is somewhat weaker;
- tend to prefer options aimed at reducing water use/loss over options aimed at increasing the supply of water.

# The most favoured choices appear to be prioritised in part due to the perceived comparative ease of delivering them

Why have you picked this item as your top choice? Please provide as much detail as possible

Customers most commonly placed '**Reducing leakage**' as the top priority as this is often a very visual issue that plays out in public. It's also viewed as being a simpler fix than some other choices.

"Leaking pipes / equipment because of bursts or breaks is of the main causes to water loss.."

**Resident**

"Need to renew some water piping network as quite a few of them are built-in the Victorian era. Experience burst pipes in my local area frequently."

**Resident**

The second-highest ranked choice was '**Improve water efficiency**'. To many customers this was an opportunity to improve on existing systems rather than doing something completely new.

"It feels like the easiest thing to achieve ... using what we have, better."

**Resident**

"More efficient use of water allows existing supplies to go further"

**Resident**

Similarly to 'improve water efficiency' '**Recycle or "re-use" water indirectly**' appealed to many as being a potentially more cost-effective thing to achieve. Some also liked this as a means of being more eco friendly.

"Much more eco friendly to re-use and recycle water that is already present. More cost effective to recycle and re use"

**Resident**

"No wastage is the best way of taking care of our environment. To re-use is a sustainable way to reduce waste"

**Resident**

# DECISION METRIC WEIGHTS

# Stimulus shown in Stated Preference Choice Exercise

Respondents were shown more detail on the 10 different water resource options. Respondents were shown 10 individual slides for each option which included a description, the relative cost and whether the option would have a positive or negative impact on each of the metrics. This was then summarised so that respondents could compare the options.

**Transfer water from other regions**

Each of the measures will have symbols alongside them so that you can see how this option stacks up against the others. The symbols' meanings are shown below:

**£** This is the cost to United Utilities but will impact on customer bills further down the line. The more £ signs shown, the higher the cost and the greater the likelihood this will impact customer bills.

**+** The amount of increase in each measure this option will result in. The more green plus signs, the more the positive impact or reduction in negative effects!

**-** The amount of reduction in each measure this option will result in. The more red minus signs, the more the negative impact or increase in negative effects!

**Option description:** United Utilities could purchase water that is licensed to another water company. The bulk supply could originate from within our region but typically comes from outside our region, commonly via a pipeline from another water company.

<b>Relative cost:</b> How much this option will cost relative to the other ones you'll be shown. <span style="float: right;">£ £ £</span>	<b>Human &amp; social wellbeing:</b> Impact on the local area and environment e.g. job creation, economy, local green spaces for public health and wellbeing. <span style="float: right;">- - + +</span>
<b>Carbon emissions:</b> The release of carbon into the atmosphere. <span style="float: right;">- - + +</span>	<b>Habitats for native wildlife &amp; plants:</b> Impact on natural ecosystems, biodiversity and wildlife habitats. <span style="float: right;">- - + +</span>
<b>Flood risk:</b> likelihood this option will have a positive or negative impact on the risk of homes, businesses, gardens and public spaces flooding. <span style="float: right;">No impact</span>	<b>River flows &amp; water quality:</b> Impact on the volume and cleanliness of water available to use in rivers and lakes. <span style="float: right;">- - + +</span>

- Survey participants saw 8 questions each.
- Attribute levels varied according to an experimental design.
- Household water bill impact shown in £s while Business water bill impact shown in %.
- Outcome for exercise is a measure of customer WTP for each attribute level.
- Customer WTP used to derive decision metric weights.

Which option do you prefer?

	Plan A	Plan B
<b>River flows and water quality</b> - impact on the volume and cleanliness of water available to use in rivers and lakes. <span style="float: right;">- - + +</span>	- - + +	- - + +
<b>Carbon emissions:</b> The release of carbon into the atmosphere. <span style="float: right;">No impact</span>	No impact	No impact
<b>Flood risk:</b> likelihood this option will have a positive or negative impact on the risk of homes, businesses, gardens and public spaces flooding. <span style="float: right;">- - + +</span>	- - + +	- - + +
<b>Human &amp; social wellbeing</b> - impact on the local area and environment e.g. job creation, economy, local green spaces for public health and wellbeing. <span style="float: right;">- - + +</span>	- - + +	- - + +
<b>Habitats for native wildlife and plants</b> - impact on natural ecosystems, biodiversity and wildlife habitats. <span style="float: right;">- - + +</span>	- - + +	- - + +
<b>Your annual water bill</b>	£392 per year (£32 more than now)	£364 per year (£4 more than now)
	●	●

**+** The amount of increase in each measure this option will result in. The more green plus signs, the more the positive impact or reduction in negative effects!

**-** The amount of reduction in each measure this option will result in. The more red minus signs, the more the negative impact or increase in negative effects!

# Stimulus shown in Stated Preference Choice Exercise

## Transfer water from other regions

Each of the measures will have symbols alongside them so that you can see how this option stacks up against the others. The symbols' meanings are shown below:

This is the cost to United Utilities but will impact on customer bills further down the line. The more £ signs shown, the higher the cost and the greater the likelihood this will impact customer bills.

£

The amount of increase in each measure this option will result in. The more green plus signs, the more the positive impact or reduction in negative effects!

+

The amount of reduction in each measure this option will result in. The more red minus signs, the more the negative impact or increase in negative effects!

-

**Option description:** United Utilities could purchase water that is licenced to another water company. The bulk supply could originate from within our region but typically comes from outside our region, commonly via a pipeline from another water company.

**Relative cost:** How much this option will cost relative to the other ones you'll be shown

£ £ £

**Carbon emissions:** The release of carbon into the atmosphere

- + +

**Flood risk:** likelihood this option will have a positive or negative impact on the risk of homes, businesses, gardens and public spaces flooding

No impact

**Human & social wellbeing:** impact on the local area and environment e.g. job creation, economy, local green spaces for public health and wellbeing

- - + +

**Habitats for native wildlife & plants:** impact on natural ecosystems, biodiversity and wildlife habitats

- - + +

**River flows & water quality:** impact on the volume and cleanliness of water available to use in rivers and lakes

- - + +

Which option do you prefer?

	Plan A	Plan B
River flows and water quality - impact on the volume and cleanliness of water available to use in rivers and lakes	- - + +	- - + +
Carbon emissions: The release of carbon into the atmosphere	No impact	No impact
Flood risk: likelihood this option will have a positive or negative impact on the risk of homes, businesses, gardens and public spaces flooding	- - + +	- - + +
Human & social wellbeing - impact on the local area and environment e.g. job creation, economy, local green spaces for public health and wellbeing	- - + +	- - + +
Habitats for native wildlife and plants - impact on natural ecosystems, biodiversity and wildlife habitats	- - + +	- - + +
Your annual water bill	£392 per year (£32 more than now)	£364 per year (£4 more than now)
	●	●

The amount of increase in each measure this option will result in. The more green plus signs, the more the positive impact or reduction in negative effects!

+

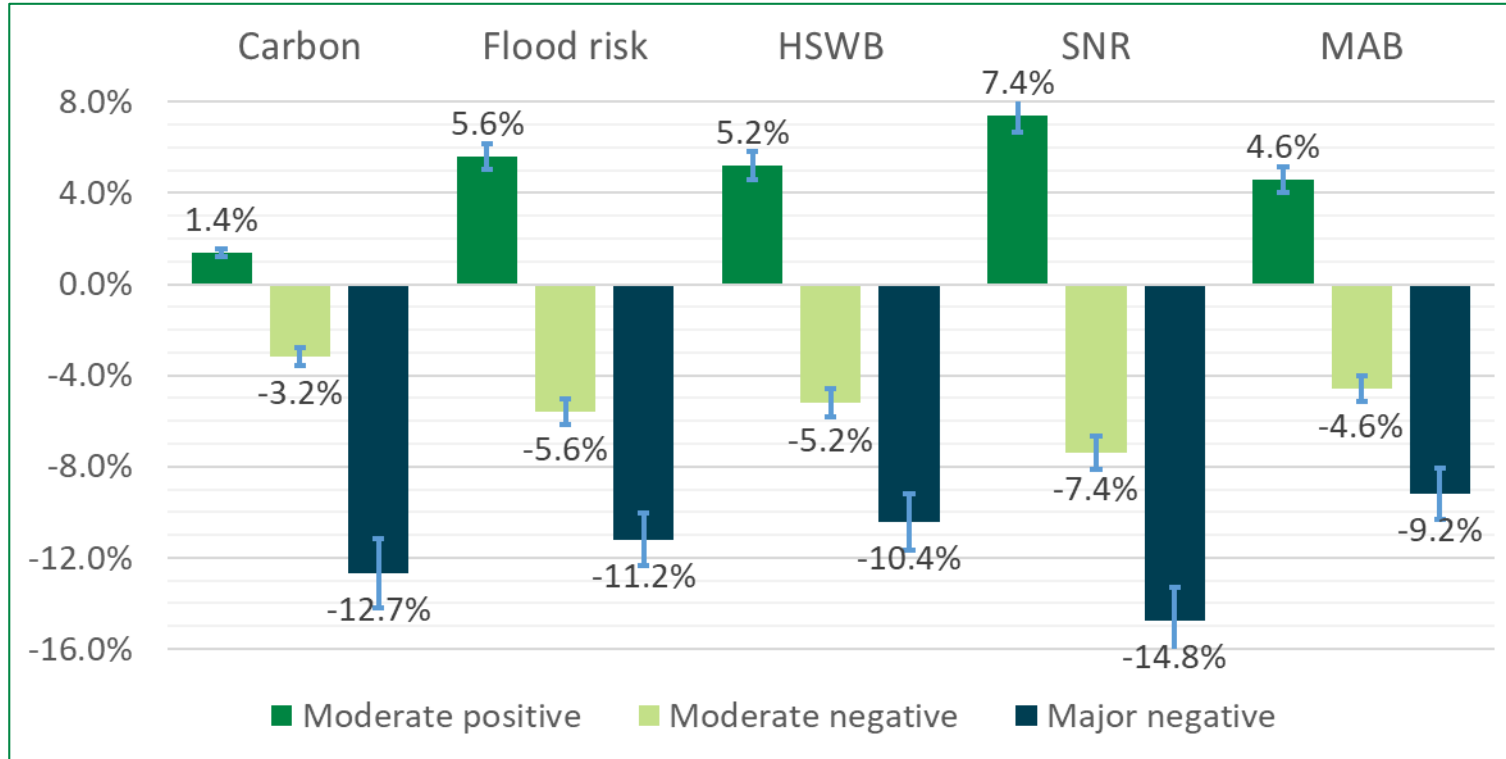

The amount of reduction in each measure this option will result in. The more red minus signs, the more the negative impact or increase in negative effects!

-

Respondents were shown more detail on the 10 different water resource options. Respondents were shown 10 individual slides for each option which included a description, the relative cost and whether the option would have a positive or negative impact on each of the metrics. This was then summarised so that respondents could compare the options.

- Survey respondents saw 8 questions each.
- Attribute levels varied according to an experimental design.
- Household water bill impact shown in £s while Business water bill impact shown in %.
- Outcome for exercise is a measure of customer WTP for each attribute level.
- Customer WTP used to derive decision metric weights.
- Joint econometric model combining households and businesses from United Utilities, Southern Trent, and South Staffs Water to obtain more precise estimates while allowing for differences across companies.

# SP Willingness to Pay: Households

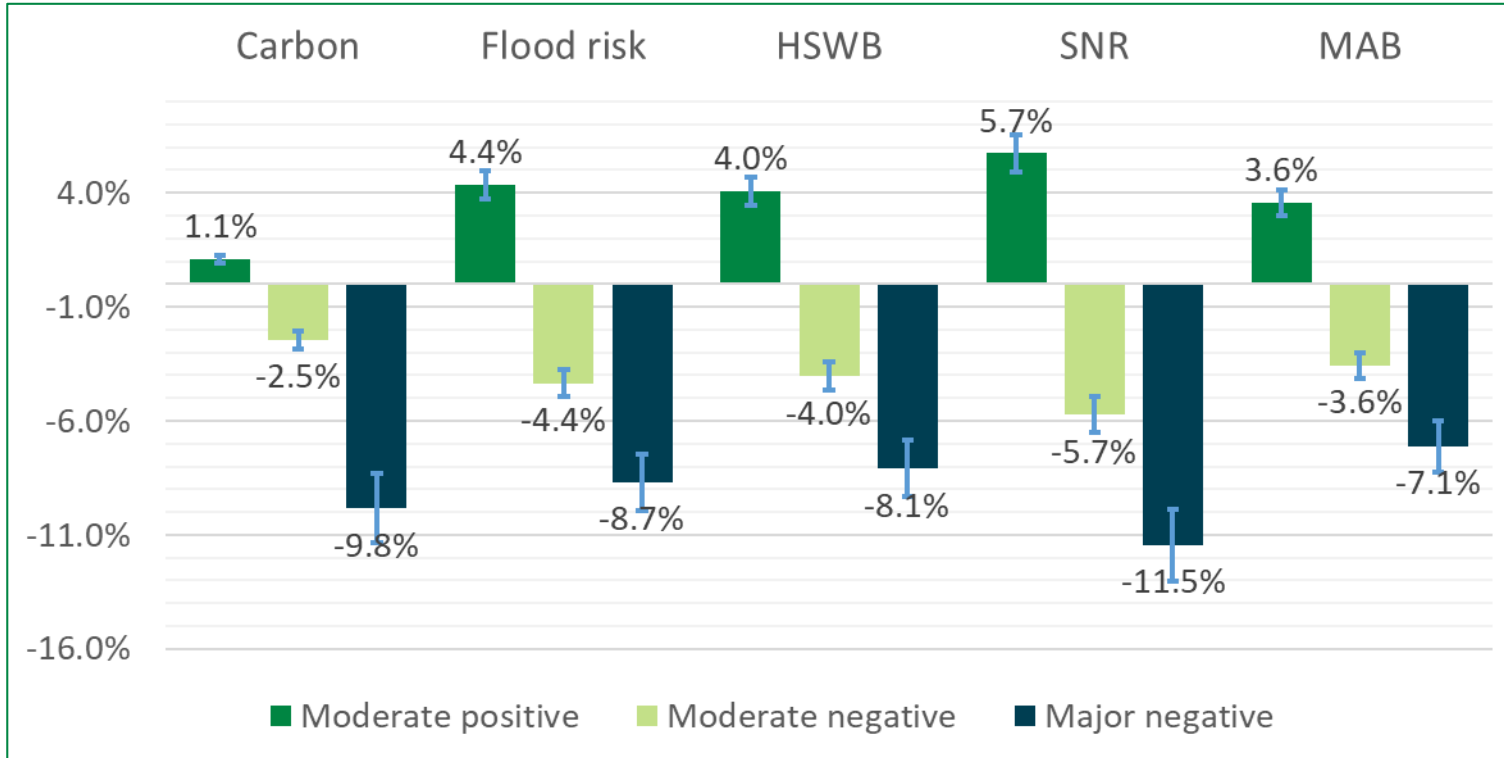

Note: The percentages indicate mean WTP referred to the annual water only bill. The vertical bars indicate 90% confidence intervals calculated using the Delta method. See Appendix for details on the calculation of WTP values.

HSWB Human & social wellbeing  
 SNR Habitats for native wildlife and plants  
 MAB River flows and water quality

## Household customers on average:

- Are willing to pay the highest/lowest proportion of their annual water only bill for a moderate positive change in Ecosystem resilience (SNR)/Carbon emissions.
- Require the highest/lowest compensatory decrease in their annual water only bill for a moderate negative change in Ecosystem resilience (SNR)/Carbon emissions.
- Require the highest/lowest compensatory decrease in their annual water only bill for a major negative change in Ecosystem resilience (SNR)/River flows and water quality (MAB).

# SP Willingness to Pay: Businesses

## Business customers on average:

- Are willing to pay the highest/lowest proportion of their annual water only bill for a moderate positive change in Ecosystem resilience (SNR)/Carbon emissions.
- Require the highest/lowest compensatory decrease in their annual water only bill for a moderate negative change in Ecosystem resilience (SNR)/Carbon emissions.
- Require the highest/lowest compensatory decrease in their annual water only bill for a major negative change in Ecosystem resilience (SNR)/River flows and water quality (MAB).

Note: The percentages indicate mean WTP referred to the annual water only bill. The vertical bars indicate 90% confidence intervals calculated using the Delta method. See Appendix for details on the calculation of WTP values.

HSWB Human & social wellbeing  
 SNR Habitats for native wildlife and plants  
 MAB River flows and water quality

# Measures of Content Validity

## HIGH LEVEL OF VALIDITY

- Very few instances of non-trading behaviour i.e. where respondents always choose the same alternative throughout the exercise.
- Positive Participant feedback: people were able to make comparisons between the options presented to them.

### SP NON-TRADERS

Measure	Household	Business	TOTAL
<b>No. of respondents</b>	653	184	837
<b>%</b>	78%	22%	100%
<b>Always chose Option A</b>	14	3	17
<b>%</b>	2%	1.6%	2%
<b>Always chose Option B</b>	7	2	9
<b>%</b>	1%	1.1%	1.1%

### SP PARTICIPANT FEEDBACK

Measure	YES	NO	TOTAL
<b>Household: Did you generally feel able to make comparisons between the choices presented to you?</b>	619	34	653
<b>%</b>	95%	5%	100%
<b>Business: Did you generally feel able to make comparisons between the choices presented to you?</b>	174	10	184
<b>%</b>	95%	5%	100%

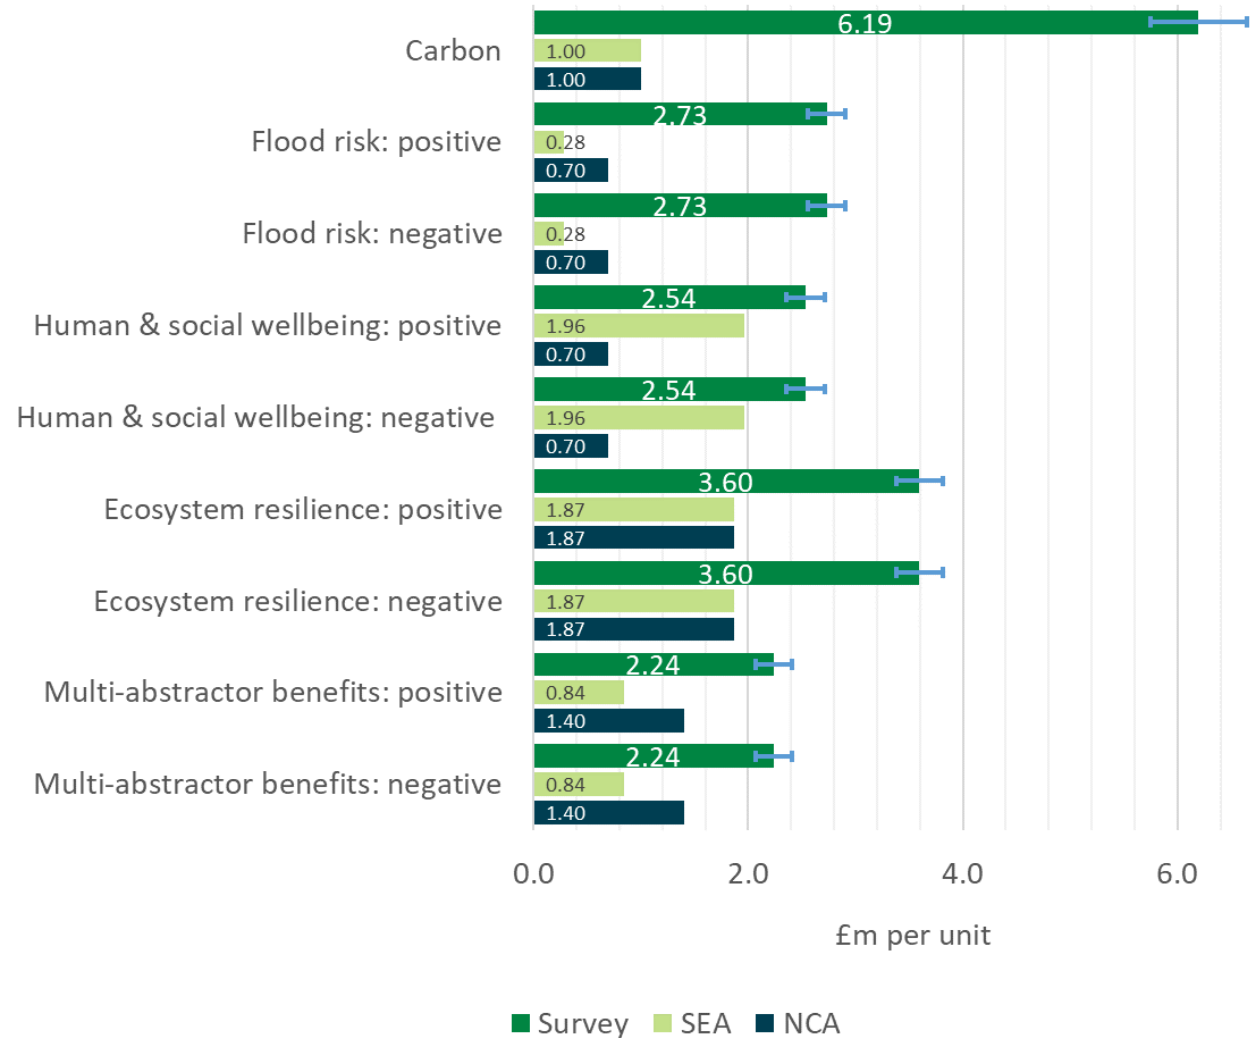

# Construct Validity

To test the construct validity of our analysis, we:

- **segment valuations for attribute levels (WTP) by customers' attitudes and concerns for the natural environment and water saving as well as several demographic characteristics**
- **compare each segment's WTP against the WTP of the complement segment ('Other') and assess statistical significance (at the 5% level) via t-tests based on the distributions of individual-level WTP values**
- We found relatively few statistically significant differences across segments defined based on attitudes and concerns.
- Improvements in carbon emissions are somewhat more highly valued by households who are very concerned about protecting water resources when compared with the less-concerned households, which is broadly in line with expectations.
- Customers from higher income households have, on average, higher valuations, of improvements in Flood risk and a somewhat higher valuation of improvements in Carbon emissions.
- Improvements in Carbon emissions are valued more highly by young customers (ages 18-29) than by older customers.
- Household customers in the Greater Manchester (Merseyside) region have, on average, a lower (higher) valuation of Habitats for native wildlife and plants, when compared to customers from other regions.

**Overall, validity analysis shows that results are robust and reliable and hence there are good grounds for its use in UU's draft WRMP.**

# WRW ValueStream Tool: Decision Metric Weights Outputs

- The preference weights of Carbon emissions are substantially higher than the SEA and NCA weights.
- The preference weights of Flood risk are substantially higher than the SEA and NCA weights.
- The preference weights of Human & social wellbeing are in between the SEA and NCA weights.
- The preference weights of Ecosystem resilience/habitats are somewhat higher than the SEA and NCA weights.
- The preference weights of Multi-abstractor benefits (impacts on rivers) are somewhat lower than the NCA weights.
- Positive impacts were as highly weighted as the equivalent-sized negative impacts in line with the outcome from the stakeholder workshops.

Note: See Appendix for details on the calculation of preference weights. The bars indicate 90% confidence intervals.

# TUBs & Extreme Events

# Valuations of TUBs and Extreme Events

**In order to calculate the customer preference for improved levels of service to avoid water restrictions (TUBs and Extreme Events) and the willingness to pay for improved service, we conducted a stated preference choice experiment.**

- Both household and business customers were invited to choose which level of service was preferable when shown different options with the associated risk of water restrictions occurring and the impact on the customer's bill.
- The exercise was conducted on TUBs and Extreme Events independently in two separate choice experiments.
- Detailed information about the two types of water restrictions was shared with the respondent through a series of Show Cards.
- Respondents were shown three options in each iteration for TUBs and two options for Extreme Events. Option 1 was the status quo/no change option and was included in all sets shown to the respondent. Options 2 and 3 were improvements to the level of service that is currently received.

## **TUBs**

- Option 1 no change (1 in 22)
- Option 2 improvement (1 in 40)
- Option 3 major improvement (1 in 100)

## **Extreme Events**

- Option 1 no change (wait until 2039)
- Option 2 improvement (1 in 500 as soon as possible)

The bill impact shown on the first iteration was randomised to avoid a starting point bias.

**A double-bounded dichotomous choice model was used** (i.e. if the respondent rejected the first price shown for improvements the question was posed again with a lower price point but if the respondent accepted the first price point then the repetition included a greater bill impact).

household customers were shown a bill impact in £'s based on their bill and business customers were shown a % bill increase.

# Stimulus shown for TUBS and Extreme Events

An inclusion criteria was set which ensured respondents had read the information about TUBs and extreme events that was shown to them during the survey and respondents who reported having difficulties in making preferences in the choice experiment were excluded from the survey.

Household

We manage the water and wastewater network in the North West of England, supplying water every day to around 7 million people and 200,000 businesses.

We need to ensure that customers have a reliable supply of clean drinking water, but there are growing pressures due to:

- Population growth in the North West**

More people means more demand on the water network.
- Climate change**

Climate change is predicted to cause drier summers, which will affect our water supplies.
- Environmental legislation**

Environmental legislation which will restrict United Utilities taking water from the environment to protect local ecosystems. This means that in the future there will be less water in the sources, such as lakes and rivers, that United Utilities currently takes water from.

In very dry weather, United Utilities will do several things to ensure that customers' water supplies are affected as little as possible.

This could include water restrictions to customers to help safeguard remaining supplies.

Types of restrictions:

- Hosepipe bans/Temporary Use Ban (TUBs)**

Currently, there is a **23%** chance of a temporary use ban happening at least once in the next 5 years

What are they?  
Temporary use bans are typically applied when it looks like a drought might develop, and include:

  - Preventing domestic activities involving a hose pipe
  - Preventing filling of swimming and paddling pools

For temporary use bans, our current level of service is at the lower end of the industry range, meaning the risk of a hosepipe ban is higher in our area, compared to others.
- Emergency restrictions**

Before the government requirements come into force, there is a **7%** chance of an emergency restriction happening at least once during 2025 – 2039

What are they?  
Emergency restrictions are applied only if the situation becomes very serious, and include:

  - Taps in the street and/or mobile water tanks for customers to access water
  - Rota cuts (water only available at certain times or on certain days)

The government have introduced a new requirement that by 2039, we must reduce the chances of these emergency restrictions happening.

Businesses

We manage the water and wastewater network in the North West of England, supplying water every day to around 7 million people and 200,000 businesses.

We need to ensure that customers have a reliable supply of clean drinking water, but there are growing pressures due to:

- Population growth in the North West**

More people means more demand on the water network.
- Climate change**

Climate change is predicted to cause drier summers, which will affect our water supplies.
- Environmental legislation**

Environmental legislation which will restrict United Utilities taking water from the environment to protect local ecosystems. This means that in the future there will be less water in the sources, such as lakes and rivers, that United Utilities currently takes water from.

In very dry weather, United Utilities will do several things to ensure that customers' water supplies are affected as little as possible.

This could include water restrictions to customers to help safeguard remaining supplies.

Types of restrictions:

- Emergency restrictions**

Before the government requirements come into force, there is a **7%** chance of an emergency restriction happening at least once during 2025 – 2039

What are they?  
Emergency restrictions are applied only if the situation becomes very serious, and include:

  - Taps in the street and/or mobile water tanks for customers to access water
  - Rota cuts (water only available at certain times or on certain days)

The government have introduced a new requirement that by 2039, we must reduce the chances of these emergency restrictions happening.

# TUBs

# TUBs – which options do household customers prefer?

Option choice (HH) by Bill impact

Analysis choices shows that as the bill impact increases, the preference for an improved level of service tend to decrease – the preference shifts from a willingness to pay for a major improvement to the more modest improvement of 1 in 40 which is preferred over the ‘no improvement’ status quo option.

Few customers choose option 3 if the price >£12.

Overall, **26.5%** of customers said they preferred the status quo option from all options shown.

Price point	Option 1 – status quo	Option 2 - improvement	Option 3 – major improvement
PP1	£0	£0.50	£3.00
PP2	£0	£1.00	£6.00
PP3	£0	£2.00	£12.00
PP4	£0	£4.00	£24.00
PP5	£0	£8.00	£48.00

# TUBs – which options do household customers prefer?

% HH customers willing to pay for improvement (1 in 40)

% HH customers willing to pay for improvement (1 in 100)

66.9% of household respondents preferred option 2 (1 in 40) over option 1 (status quo) at **£1.90**. 60% of customers would be willing to pay **£4.75**.

The average willingness to pay for the improved level of service (1 in 40) was **£6.04**.

Less than a third of customers (33.0%) would be willing to pay £11.10 for the major improvement. The average WtP for 1-in-100 is £8.38.

	Prefer Status Quo option	60% acceptance	% willing to pay at least <b>£1.90</b>	WtP (95% confidence interval)
TUBs (1 in 40)	26.5%	£4.75	66.9%	<b>£6.04</b> (£5.65, £6.43)
			% willing to pay at least <b>£11.10</b>	WtP (95% confidence interval)
TUBs (1 in 100)			33.0%	£8.48 (£7.13, £9.48)

# Subgroup analysis

Willingness to pay for service improvements is higher in households with a more positive financial situation.

# Extreme Events

# Extreme Events – which options do household customers prefer?

Option choice (HH) by Bill impact

Analysis of the first choice set shows preference is firmly in favour of an improved level of service for Extreme Events. Even at the highest Bill Impact shown to respondents we see three quarters of customers preferring the improvement over the status quo.

As the Bill impact increases, the preference for an improved level of service decreases.

Overall, 14% of respondents preferred the Status Quo.

Price point	Option 1 – status quo	Option 2 - improvement
PP1	£0	£0.50
PP2	£0	£1.00
PP3	£0	£1.50
PP4	£0	£2.00
PP5	£0	£4.00

# Extreme Events – which options do Household customers prefer?

	Prefer Status Quo option	60% acceptance	70% acceptance	% willing to pay at least £1.10	WtP (95% confidence interval)
Extreme Events	14.0%	£11.86	£5.90	82.3%	£4.56 (£4.38, £4.74)

82.3% of household customers preferred option 2 (moving to 1 in 500 as soon as possible) over option 1 (by 2039) at **£1.10**.

60% of UU household customers would accept a bill increase of **£11.86** to achieve the improved service level and 70% of customers would accept a bill increase of **£5.90**

The average willingness to pay for the improved level of service was **£4.56**.

% HH customers willing to pay for improvement (1 in 100)

# Subgroup analysis

Willingness to pay for service improvements is higher in households with a more positive financial situation.

# Business Customer Valuations of Extreme Events

**N=184 Business customer completed the stated preference choice experiment to express their desired level of service in relation to Extreme Events.**

- Customers were invited to choose which level of service was preferable when shown different options with the associated risk of water restrictions occurring and the impact on the customer’s bill.
- N=184 UU business customers were interviewed and data was weighted to reflect the profile of North West businesses as a whole in terms of business size.

Business size	Unweighted	Weighted
Micro (0-9)	20%	35%
Small (10-49)	23%	20%
Medium (50-249)	31%	24%
Large(250+)	26%	21%

## Extreme Events

Option 1 no change (wait until 2039)

Option 2 improvement (1 in 500 as soon as possible)

The bill impact shown on the first iteration was randomised to avoid a starting point bias.

**A double-bounded dichotomous choice model was used** (i.e. if the respondent rejected the first price shown for improvements the question was posed again with a lower price point but if the respondent accepted the first price point then the repetition included a greater bill impact).

Business customers were shown a bill impact in % increase based on their bill.

# Extreme Events – which options do NHH customers prefer?

Option choice (NHH) by Bill impact

Analysis of the first choice set shows preference is in favour of an improved level of service for Extreme Events across all bill impacts shown.

At the highest bill impact, an increase of 0.9% on water bills, 57% of business customers preferred the improved level of service.

Overall, 22% of business respondents preferred the Status Quo across all the options they were shown.

Price point	Option 1 – status quo	Option 2 - improvement
PP1	£0	0.1%
PP2	£0	0.2%
PP3	£0	0.4%
PP4	£0	0.5%
PP5	£0	0.9%

# Extreme Events – which options do NHH customers prefer?

	Prefer Status Quo option	60% acceptance	% willing to pay at least +0.4%	WtP (95% confidence interval)
Extreme Events	22%	+0.61% increase on bill	62.5%	+0.57% (0.5%, 0.65%)

62.5% of business respondents preferred option 2 (moving to 1 in 500 as soon as possible) over option 1 (by 2039) at **+0.4% increase to bill**.

60% of customers would accept a bill increase of **+0.61%** to achieve the improved service level

The average willingness to pay for the improved level of service was **+0.57%**.

% HH customers willing to pay for improvement (1 in 100)

## Subgroup analysis

Willingness to pay is very similar for medium and large businesses, highest levels of willingness to pay amongst small businesses. Higher willingness to pay noted for businesses with high reliance on water, though not significantly so.

		Extreme Events			
	Subgroup	Prefer status quo	60% acceptance	% willing to pay at least +0.4%	WtP (95% confidence interval)
Business size	<b>Micro (0-9)</b>	25%	+0.52%	62%	0.53% (0.41%, 0.65%)
	<b>Small (10-49)</b>	12%↓	+0.69%↑	76%↑	0.68% (0.51%, 0.85%)
	<b>Medium (50-249)</b>	23%	+0.36%	57%	0.51% (0.36%, 0.67%)
	<b>Large(250+)</b>	25%	+0.37%	57%	0.52% (0.32%, 0.72%)
Water reliance	<b>Low</b> (for example similar to a household, hairdresser, office with less than 50 employees)	22%	+0.57%	65%	0.58% (0.47%, 0.69%)
	<b>Medium</b> (for example, office of more than 50 employees, a car wash, a large business where water is not a key component, small farmer)	24%	+0.35%	56%	0.51% (0.39%, 0.63%)
	<b>High</b> (For example, large manufacturing business, a large chemical company, large (arable) farmer)	15%	+0.63%	70%	0.73% (0.44%, 1.02%)

↓ indicates a significantly lower result compared to the average

↑ indicates a significantly higher result compared to the average

Improve water efficiency	-0.393	0.4186	-0.94	0.347	-1.214	0.427
No of observations	18117(671*10+9+8)					
No of respondents	671					
Pseudo R <sup>2</sup>	0.13					

Mixed logit estimates. The sign of the estimated standard deviations is irrelevant.

- Respondents asked to indicate top three priorities
- Omitted base option: Transfer from other regions (serves as base)
- Data organised as ‘exploded choice sets’, yielding three choices for each participant (preferred option from a set of 10 options; preferred option from the remaining 9 options; etc.)
- The model fits the data well (pseudo R<sup>2</sup> = 0.13)
- Most mean and standard deviation coefficients are highly statistically significant
- Individual-level coefficients were derived for each random coefficient and every participant
- Priority scores were calculated at the individual level by dividing each option’s exponentiated coefficient by the sum of exponentiated coefficients over all options (including the omitted base option), giving a measure on a 0-100 scale
- Individual-level priority scores were averaged over the relevant sub-samples to obtain segment rankings

# Options Ranking Econometric Model: Business

Choice	Coef.	Std.Err	Z value	P value	Lower	Upper
<b>Mean</b>						
Managing the land	0.770	0.2394	3.22	0.001	0.301	1.239

Increase capacity of WTW	-0.733	0.8860	-0.83	0.408	-2.470	1.004
Reduce leakage	3.023	0.8186	3.69	0.000	1.418	4.627
Install more water meters	3.353	1.3235	2.53	0.011	0.759	5.947
Improve water efficiency	2.140	0.6698	3.19	0.001	0.827	3.453
No of observations	4968(184*10+9+8)					
No of respondents	184					
Pseudo R <sup>2</sup>	0.05					

Mixed logit estimates. The sign of the estimated standard deviations is irrelevant.

- Respondents asked to indicate top three priorities
- Omitted base option: Transfer from other regions (serves as base)
- Data organised as ‘exploded choice sets’, yielding three choices for each participant (preferred option from a set of 10 options; preferred option from the remaining 9 options; etc.)
- The pseudo R<sup>2</sup> of 0.05 is relatively low
- A number of mean coefficients are not statistically significant indicating that, at the mean, the relevant options were not considered to be substantially more or less important than transferring water from other regions (omitted base option)
- Preferences vary across the NHH customer base as indicated by the statistically significant standard deviations for six of the options
- Priority scores were calculated at the individual level in the same way as for households
- Individual-level priority scores were averaged over the relevant sub-samples to obtain segment rankings

# Statistically Significant Differences in Priorities: Households

1 <sup>st</sup>	<b>Reduce leakage:</b> No significant differences found	
2 <sup>nd</sup>	<b>Improve water efficiency:</b> No significant differences found	
3 <sup>rd</sup>	<b>Recycle or 're-use' water indirectly:</b> No significant differences found	
4 <sup>th</sup>	<b>Managing the land to improve water quality</b> Customers aged 18-29 yrs (3 <sup>rd</sup> ↑)	
5 <sup>th</sup>	<b>Install more water meters:</b> No significant differences found	
6 <sup>th</sup>	Customers aged 60-74 yrs (7 <sup>th</sup> ↓) Cheshire (7 <sup>th</sup> ↓) Unmetered (7 <sup>th</sup> ↓)	Customers aged 30-44 yrs (6 <sup>th</sup> ↑) Metered (6 <sup>th</sup> ↑)
7 <sup>th</sup>	Merseyside (7 <sup>th</sup> ↓) HH income > £20,000 (7 <sup>th</sup> ↓) Metered (7 <sup>th</sup> ↓)	Lancashire (6 <sup>th</sup> ↑) HH income < £20,000 (5 <sup>th</sup> ↑) Unmetered (6 <sup>th</sup> ↑)
8 <sup>th</sup>	<b>Take more water from under the ground:</b> No significant differences found	
9 <sup>th</sup>	<b>Transfer water from other regions:</b> No significant differences found	
10 <sup>th</sup>	<b>Take more water from rivers and lakes</b> Cumbria (8 <sup>th</sup> ↑)	

**Overall, the household customer base is relatively homogenous in terms of supply-demand priorities**

- Significant differences between any segment and the complement 'Other' (e.g., age group 18-29 vs those above the age of 29):
  - rank difference of at least one place
  - difference between priority scores statistically significant at the 5% level
- ↑ (↓) indicates higher (lower) priority than for the complement segment

# Statistically Significant Differences in Priorities: Businesses

1 <sup>st</sup>	<b>Reduce leakage</b>	Large (250+ employees) (2 <sup>nd</sup> ↓)
2 <sup>nd</sup>	<b>Improve water efficiency:</b>	No significant differences found
3 <sup>rd</sup>	<b>Recycle or 're-use' water indirectly:</b>	No significant differences found
4 <sup>th</sup>	<b>Managing the land to improve water quality</b>	Micro (0-9 employees) (5 <sup>th</sup> ↓)      Large (250+ employees) (4 <sup>th</sup> ↑) Low water consumption (5 <sup>th</sup> ↓)      Medium water consumption (4 <sup>th</sup> ↑)
5 <sup>th</sup>	<b>Increase the size of existing reservoirs</b>	Small (10-49 employees) (6 <sup>th</sup> ↓)
6 <sup>th</sup>	<b>Increase capacity of water treatment works</b>	Micro (0-9 employees) (7 <sup>th</sup> ↓)      Large (250+ employees) (5 <sup>th</sup> ↑) Low water consumption (6 <sup>th</sup> ↑)
7 <sup>th</sup>	<b>Install more water meters:</b>	No significant differences found
8 <sup>th</sup>	<b>Take more water from under the ground</b>	Large (250+ employees) (7 <sup>th</sup> ↑)
9 <sup>th</sup>	<b>Transfer water from other regions</b>	Large (250+ employees) (10 <sup>th</sup> ↓)
10 <sup>th</sup>	<b>Take more water from rivers and lakes:</b>	No significant differences found

There were relatively many differences considering that subgroup analysis was carried out only by business size and water consumption/reliance

- Significant differences between any segment and the complement 'Other' (e.g., micro businesses vs all other businesses combined):
  - rank difference of at least one place
  - difference between priority scores statistically significant at the 5% level
- ↑ (↓) indicates higher (lower) priority than for the complement segment

# Choice Experiment Econometric Model

<b>No of observations</b>	34,752(2,172*8*2)					
<b>No of respondents</b>	2,172(765 [ST] + 837 [UU] + 570 [SSW])					
<b>Pseudo R<sup>2</sup></b>	0.14					

Note: Mixed logit estimates. The sign of the estimated standard deviations is irrelevant. The sample combines household and business customers of Severn Trent Water (ST), United Utilities Water (UU), and South Staffs Water (SSW).

- The analysis is based on a joint mixed logit model combining households and businesses from United Utilities, Severn Trent, and South Staffs Water. Weights were applied to reflect relative wholesale revenue contributions from each of the six segments. The random coefficients were assumed to have independent normal distributions.
- The attribute levels were translated to scores obtained from “ValueStream1\_R05-00”, except for Carbon. The scores for Carbon were derived by calculating the NPV of carbon emissions equivalent to each of the levels of the metric based on the time series of ‘Central’ values contained in BEIS (2021) ‘Supplementary appraisal guidance on valuing energy use and greenhouse gas (GHG) emissions’.
- Bill changes are measured in £ per household per year for households and in percentage points of the annual combined water and wastewater bill for businesses.
- The initial (conditional logit) specification included a set of interaction terms between attribute levels (including bill change) and dummy variables for companies and business customers. Statistically not significant interactions were dropped in a stepwise procedure.
- The signs of the coefficients are all in line with expectations and the model provides a good fit to the data.
- There is significant heterogeneity in preferences as indicated by the standard deviation coefficients.

# Calculation of WTP values

- The coefficient estimates from the econometric model are used to derive mean WTP values for the attribute levels
  - for households in terms of £ per household per year per unit score
  - and for businesses as a percentage of the annual combined water and wastewater bill per unit score
- The WTP values for households are translated in terms of % of United Utilities' water only bill by multiplying the former values by the score values and then dividing the product by the average annual household water only bill of £202.
- The WTP values for businesses are translated in terms of % of United Utilities' water only bill by multiplying the former values by the score values and multiplying the product by the ratio of the average annual combined (water and wastewater) bill of £422 and the average annual household water only bill of £202.

## Calculation of preference weights

- Mean WTP values per unit of score were calculated as a percentage of the United Utilities annual average water bill for households and businesses as detailed above.
- The cost-equivalent of the bill impacts for the different attribute levels were then calculated (in £m NPV) separately for households and businesses based on a data from United Utilities showing that 1% on the annual United Utilities water bill was equivalent to £199.3million NPV of totex.
- Household and business results were combined with weights based on wholesale water revenue contribution to United Utilities. The shares of wholesale revenue attributable to households and businesses were calculated as 73% and 27% respectively.

# Calculation of preference weights

- Scaling factors were applied to the raw weights to adjust for differences in company size.
- To calculate the scaled/adjusted weights, we used the following data:
  - The size of the 2050 WRW deficit, measured in ML/day
  - The median-sized scheme in WRW, also measured in ML/day
  - Population in each company area, derived from GIS analysis of Ofwat boundary shapefiles and Census 2011 data.
- The scaling factors for SSW, UU and SVT were calculated to be equal to the number of median-sized supply-demand options needed to address the WRW deficit, allocated across WRW companies in proportion to the population in each company's supply area.
- These scaling factors can be interpreted as the number of average-sized schemes needed to meet the 2050 deficit for all three companies if this deficit were allocated proportionally to population across companies. Applying these scaling factors is consistent with the interpretation of customers' choice data as reflecting preferences across metrics for an average sized scheme.

# Quality control

As standard in the industry quality checks are implemented to ensure that the data collected is of sufficient quality and robustness. The most common checks are for respondents who have completed the survey in an unrealistic timeframe (meaning it is unlikely they have read through the stimulus). However, given the amount of stimulus a question was added to help determine if the materials were fully understood. Despite the cognitive interviews improving the experience, it was clear that there was a proportion who struggled with the choice experiment.

For those who said they struggled to understand the survey a follow up open ended question was provided so they could provide details on why this was the case.

If the respondent was clearly unable to provide an informed answer/ didn't understand what was being required of them they were removed from the survey.

**142 household respondents were excluded from the study because they did not feel they had been able to faithfully complete the water resources choice experiment.**

**64 business respondents were removed using the same criteria.**

# Study inclusion

# Further investigation of excluded respondents

Our sample of n=671 respondents all met the strict inclusion criteria. We actually interviewed a much larger number of UU customers but n=142 were excluded from the study because they did not feel they had been able to faithfully complete the water resources choice experiment.

Analysis of the n=142 respondents has been conducted. We're interested in finding out if this group of customers had different preferences in TUBs and Extreme Event levels of service. The excluded customers tended to be older, more likely to be from Lancashire and more likely to be male.

SEG	Included	Excluded
ABC1	53%	64%
C2DE	47%	36%

Gender	Included	Excluded
Male	49%	59%
Female	51%	41%

Age	Included	Excluded
Age 18 to 29	5%	5%
Age 30 to 44	22%	19%
Age 45 to 59	34%	23%
Age 60 to 74	25%	37%
Age 75 Plus	14%	17%

Location	Included	Excluded
Merseyside	20%	11%
Cumbria	7%	8%
Gr Manc	37%	30%
Lancashire	21%	35%
Cheshire	14%	16%

# Further investigation of excluded respondents

The respondents who are excluded from the study because they had struggled with the Choice Experiment element have lower willingness to pay estimates and a higher preference for keeping things as they are with no bill impact.

The pattern of preference within the excluded groups follows the general pattern we've seen throughout the study – that there is a strong preference for the improved level of Extreme Events service provision and the majority of customers also would like to see the level of TUBs service improved.

TUBs (1 in 40)	WtP	% willing to pay at least <u>£1.90</u>	Prefer Status Quo option
Included	<b>£6.04</b>	67%	27%
Excluded	<b>£5.51</b>	59%	34%

Extreme Events	WtP	% willing to pay at least <u>£1.10</u>	Prefer Status Quo option
Included	<b>£4.56</b>	82%	14%
Excluded	<b>£4.31</b>	74%	19%
